

SOFTWARE DEVELOPMENT TEAM RECRUITMENT – ROUND 1 ASSIGNMENT

Task 1:

If I were a developer at Instagram, these features I would definitely add :

1. To share PDFs and other file types directly in chats.

Reason:

Many people communicate only through Instagram and don't want to exchange phone numbers. In many situations we need notes, assignments, presentations, or official documents but we are not able to send. We can currently send only images and videos. If I add this feature of sharing PDF, Word, and other file formats, people / users share important documents without switching to another app like WhatsApp or email. This would make Instagram much more useful for students, and make it more famous.

2. Add an **Ai song recommendation** feature that automatically suggests the best songs for a photo or video before posting it.

The AI would analyze the uploaded photo or video by

Its Colors , location ,weather, content,expression, emotions behind that photo , which type of caption I using, and then seach deeply from Instagram's music library and recommend songs that perfectly match the content.

Reason:

Currently, people spend a lot of time searching for the perfect song for their story or post. Finding music that matches the mood, colors, location, and overall feeling of the content can be difficult and time-consuming. An AI-powered recommendation system would instantly understand the post's context and emotions, saving time. It would also help people to discover new songs they might never have found on their own.

3. Add a **Mood Based Reel Feed** that allows users/ people to choose the type of reels they want to watch at that moment.

Users could instantly switch their feed based on their current mood, such as:

Funny , Educational , Fitness ,Music , Travel , Food ,Business & Finance , Gaming , Romantic , Relaxing , Photography ,Motivation, Nature.

One more option :Switches back to Instagram current recommendation system, where random reels are shown based on the algorithm and the user's activity.

Reason:

Currently, users have no control over the type of reels they see because Instagram's algorithm decides everything. Sometimes people want to watch specific content, while at other times they simply want to discover random and trending videos. By offering both **Mood Mode** and **Explore Mode**, Instagram would give users complete control over their experience without removing the excitement of discovering new content through random recommendations. This makes the platform more personalized and enjoyable for every type of user.
